

Starting Scenarios

0. Change to the directory to the Project folder

```
> cd project
```

1. To run a scenario such as scenario_1, type

```
> bash scripts/scenario_1
```

2. This will automatically, compile the C++, clear the scenario_1 folder and make a new one. The topology file is also automatically created.
3. Kindly, wait for the nodes and controller to finish before running other scenarios. They will display a **done** message such as:

```
>  
Node 0 Done  
Node 1 Done  
Node 2 Done  
...  
Controller Done
```

Note: These messages may be out-of-order, I will try to learn more about linux kernel soon for scheduling.

4. All Scenarios are handled automatically such as giving correct arguments, killing Nodes (like Node 4 in Scenario 4) etc.
